SIGNALS: our read

"AI brain fry": March 2026 release of results of BCG Henderson Institute + Harvard Business Review research conducted January 2026

"AI brain fry": mental fatigue from excessive use or oversight of AI tools beyond one's cognitive capacity. Acute, resolves with rest, but worsens session by session if conditions don't change.

REDUCES BURNOUT (-15%)

AI replaces tasks

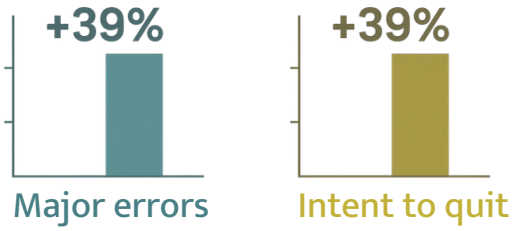
Offloads repetitive "toil." Emotional exhaustion drops. Workers report more engagement and social connection.

CAUSES BRAIN FRY

AI adds to tasks

Output expectations rise without removing anything. Oversight, monitoring, verification layered on top of existing work.

COSTS



HEALTHIER TOOLS WOULD LOOK LIKE . . .

Designed with neurobiology in mind, not just optimized for speed and output. The goal is sustainable value, not just more throughput.

Support mind wandering

Reduces intense attentional demand. Leaves room for the diffuse thinking where insight and creativity actually happen.

Foster social engagement

Keeps humans in contact with each other, not just with the tool. Connection is protective against cognitive and emotional depletion.

Scaffold skill development

Builds human capacity rather than substituting for it. Workers grow alongside the tool rather than being managed by it.

Most current AI tools are optimized for the opposite, maximum attention

ORGANIZATIONAL CONDITIONS MADE A DIFFERENCE

ORGANIZATIONAL CONDITIONS MADE A DIFFERENCE

MANAGER

Answers employee AI questions: -15% fatigue

"Figure it out yourself" culture: +5% fatigue

TEAM

Group norms reinforced healthy and harmful AI patterns equally

Uneven adoption increased fatigue, AI embedded as shared capacity reduced it.

ORGANIZATION

Work-life balance culture: -28% fatigue (largest single delta in the results)

"AI means more work": +12% fatigue

BCG Henderson Institute / Harvard Business Review, 1,488 full-time US workers, across industries, roles, and levels, surveyed January 2026. Read the details.
